### **Persistence and degradability**

no data available

### **Bioaccumulative potential**

An estimated BCF value of 2 was calculated for C.I. Acid Blue 1(SRC), using a measured water solubility of 30,000 mg/l(1) and a recommended regression-derived equation(2). According to a classification scheme(3), this BCF value suggests that bioconcentration in aquatic organisms is low(SRC).

### **Mobility in soil**

The Koc of C.I. Acid Blue 1 is estimated as approximately 15(SRC), using a measured water solubility of 30,000 mg/l(1) and a regression-derived equation(2,SRC). According to a recommended classification scheme(3), this estimated Koc value suggests that C.I. Acid Blue 1 has very high mobility in soil(SRC). Due to the ionic nature of the dye, the retention of C.I. Acid Blue 1 by ion-exchange processes(4,SRC), particularly on clay surfaces and adsorption at mineral surfaces such as goethite(5,SRC), may slow down or prevent leaching(SRC).

### **Other adverse effects**

no data available

## SECTION 13: Disposal considerations

### Disposal methods

#### Product

The material can be disposed of by removal to a licensed chemical destruction plant or by controlled incineration with flue gas scrubbing. Do not contaminate water, foodstuffs, feed or seed by storage or disposal. Do not discharge to sewer systems.

#### Contaminated packaging

Containers can be triply rinsed (or equivalent) and offered for recycling or reconditioning. Alternatively, the packaging can be punctured to make it unusable for other purposes and then be disposed of in a sanitary landfill. Controlled incineration with flue gas scrubbing is possible for combustible packaging materials.
